extensive ice sheets in both northern and southern hemispheres. By this definition, we are in an interglacial period—the Holocene. The amount of heat-trapping gases emitted into Earth's oceans and atmosphere is predicted to prevent the next glacial period, which otherwise would begin in around 50,000 years, and likely more glacial cycles.

Ice age - Wikipedia

Origin and definition.

The last glacial period is often colloquially referred to as the "last ice age", though the term ice age is not strictly defined, and on a longer geological perspective the last few million years could be termed a single ice age given the continual presence of ice sheets near both poles.

About 100,000 years ago, the climate cooled again and a glacier, the Laurentide Ice Sheet, spread across the continent. Near the end of the cycle, beginning about 31,500 years ago, the glacier began its advance into Wisconsin. It expanded for 13,500 years before temperatures warmed again and it began to melt back.
