Plate tectonics is a theory which states that Planet Earth's lithosphere (the crust and the upper mantle) is made up of solid plates which float on an underground ocean of magma. These plates are proven to move around. This movement results in earthquakes in the short term, and the movement of continents over hundreds of millions of years.

mantle, Earth's surface is dramatically reshaping itself in an endless, slow-motion movement called plate tectonics. Tectonic plates or huge slabs of solid rocks separate, collide, and slide past each other causing earthquakes, feeding volcanic eruptions, and raising mountains. Scientists now have a fairly good understanding of how the plates move and how such movements relate to earthquake activity. Most movement occurs along narrow zones between plates, plate
