The composition of relatively complex mixtures of metal ions can be determined using qualitative analysis, a procedure for discovering the identity of metal ions present in the mixture (rather than quantitative information about their amounts). The procedure used to separate and identify more than 20 common metal cations from a single solution consists of selectively precipitating only a few kinds of metal ions at a time under given sets of conditions.

Qualitative analysis is a branch of analytical chemistry that identifies particular substances in a given sample of material. In this experiment, you will analyze a known solution that contains all the Group I cations—silver, lead, and mercury(I)—and an unknown solution to determine which of these ions are present and which are absent.

### **Qualitative Analysis of Group I Cations- The Silver Group**

Steps of Qualitative Analysis If the sample is presented as a solid (salt), it's important to note the shape and color of any crystals. Reagents are used to separate cations into groups of related elements. Ions in a group are separated from each other. After each separation stage, a test is ...
